The \$12.5 Billion Problem Nobody's Talking About

You know that feeling when your phone dies at 15% battery? Now imagine that happening to entire cities. Last February, California curtailed 2.4 GWh of solar energy in a single week - enough to power 80,000 homes. That's the dirty secret of our clean energy transition: we're throwing away sunlight like yesterday's leftovers.

Why does this happen? Let's break it down:

- Conventional lead-acid batteries degrade 30% faster in extreme heat
- Lithium-ion systems lose 2-3% capacity annually even when idle
- Most commercial solutions offer
